## DISCLAIMERS

### COVERED MEDIA QUERY SPANS

The use of media querying is not ideal, nor is it desirable. It is a tense compromise that is present to facilitate the design, as a reflection (hence image) and not a container.

We implement media query spans with an adaptive mindset, prioritizing the “default” interface – exiting it once it no longer works well enough to use.

As such, below 1200px the website switches to an “alternative” interface that makes it easier to navigate the website, given the width of the browser window. We also introduce menuing and hierarchies that account for the majority use-case of narrower browser windows – that being mobile and tablet use.

Integrated into the “alternative” interface is a responsive breakpoint that makes use of the every-layout tool “sidebar”. The major benefit of using the sidebar tool is that it automatically gives the website a breakpoint of hiearchy in menuing and content between a landscape and portrait orientation

- def-interface, intended for the draggable windows interface (>1200px)
- alt-interface, intended for the touch device sensibilities interface (<1199px)

### USE OF EVERY-LAYOUT TOOLS *WITH REGARDS TO MOCKUP*

A fair amount of the structure and systems for the website relies on what has been developed by every-layout. This means that the mockup approximates a lot of the sizes and dimensions of the actual website.

This is not worrisome as the actual website is fundamentally informed by the mockup. The website might differ in ways that do not break the mockup but that respond to the constraints and realities of modern web design (which every-layout so elegantly aims to do)

The strakest example would be the font size. We use in the mockup ‘pnt’ as the unit for styles. The actual website font sizes uses the harmonic scale principle derived from the ‘em’ unit.

daily track idea:

every day a different song is made available for the user to listen to.

the feature reads the day of the month that the user is browsing on. it then pulls from a linked folder (playlist) a song that has been labeled with the corresponding number.

the user is limited to minimal playback control. we do not disclose the name of the track and do not allow for scrubbing through the song.

# **PLAYER APPEARANCE**

one option is to have the player be a small graphic that is toggled somewhere within the browser window. it either lets the user play or pause the track.

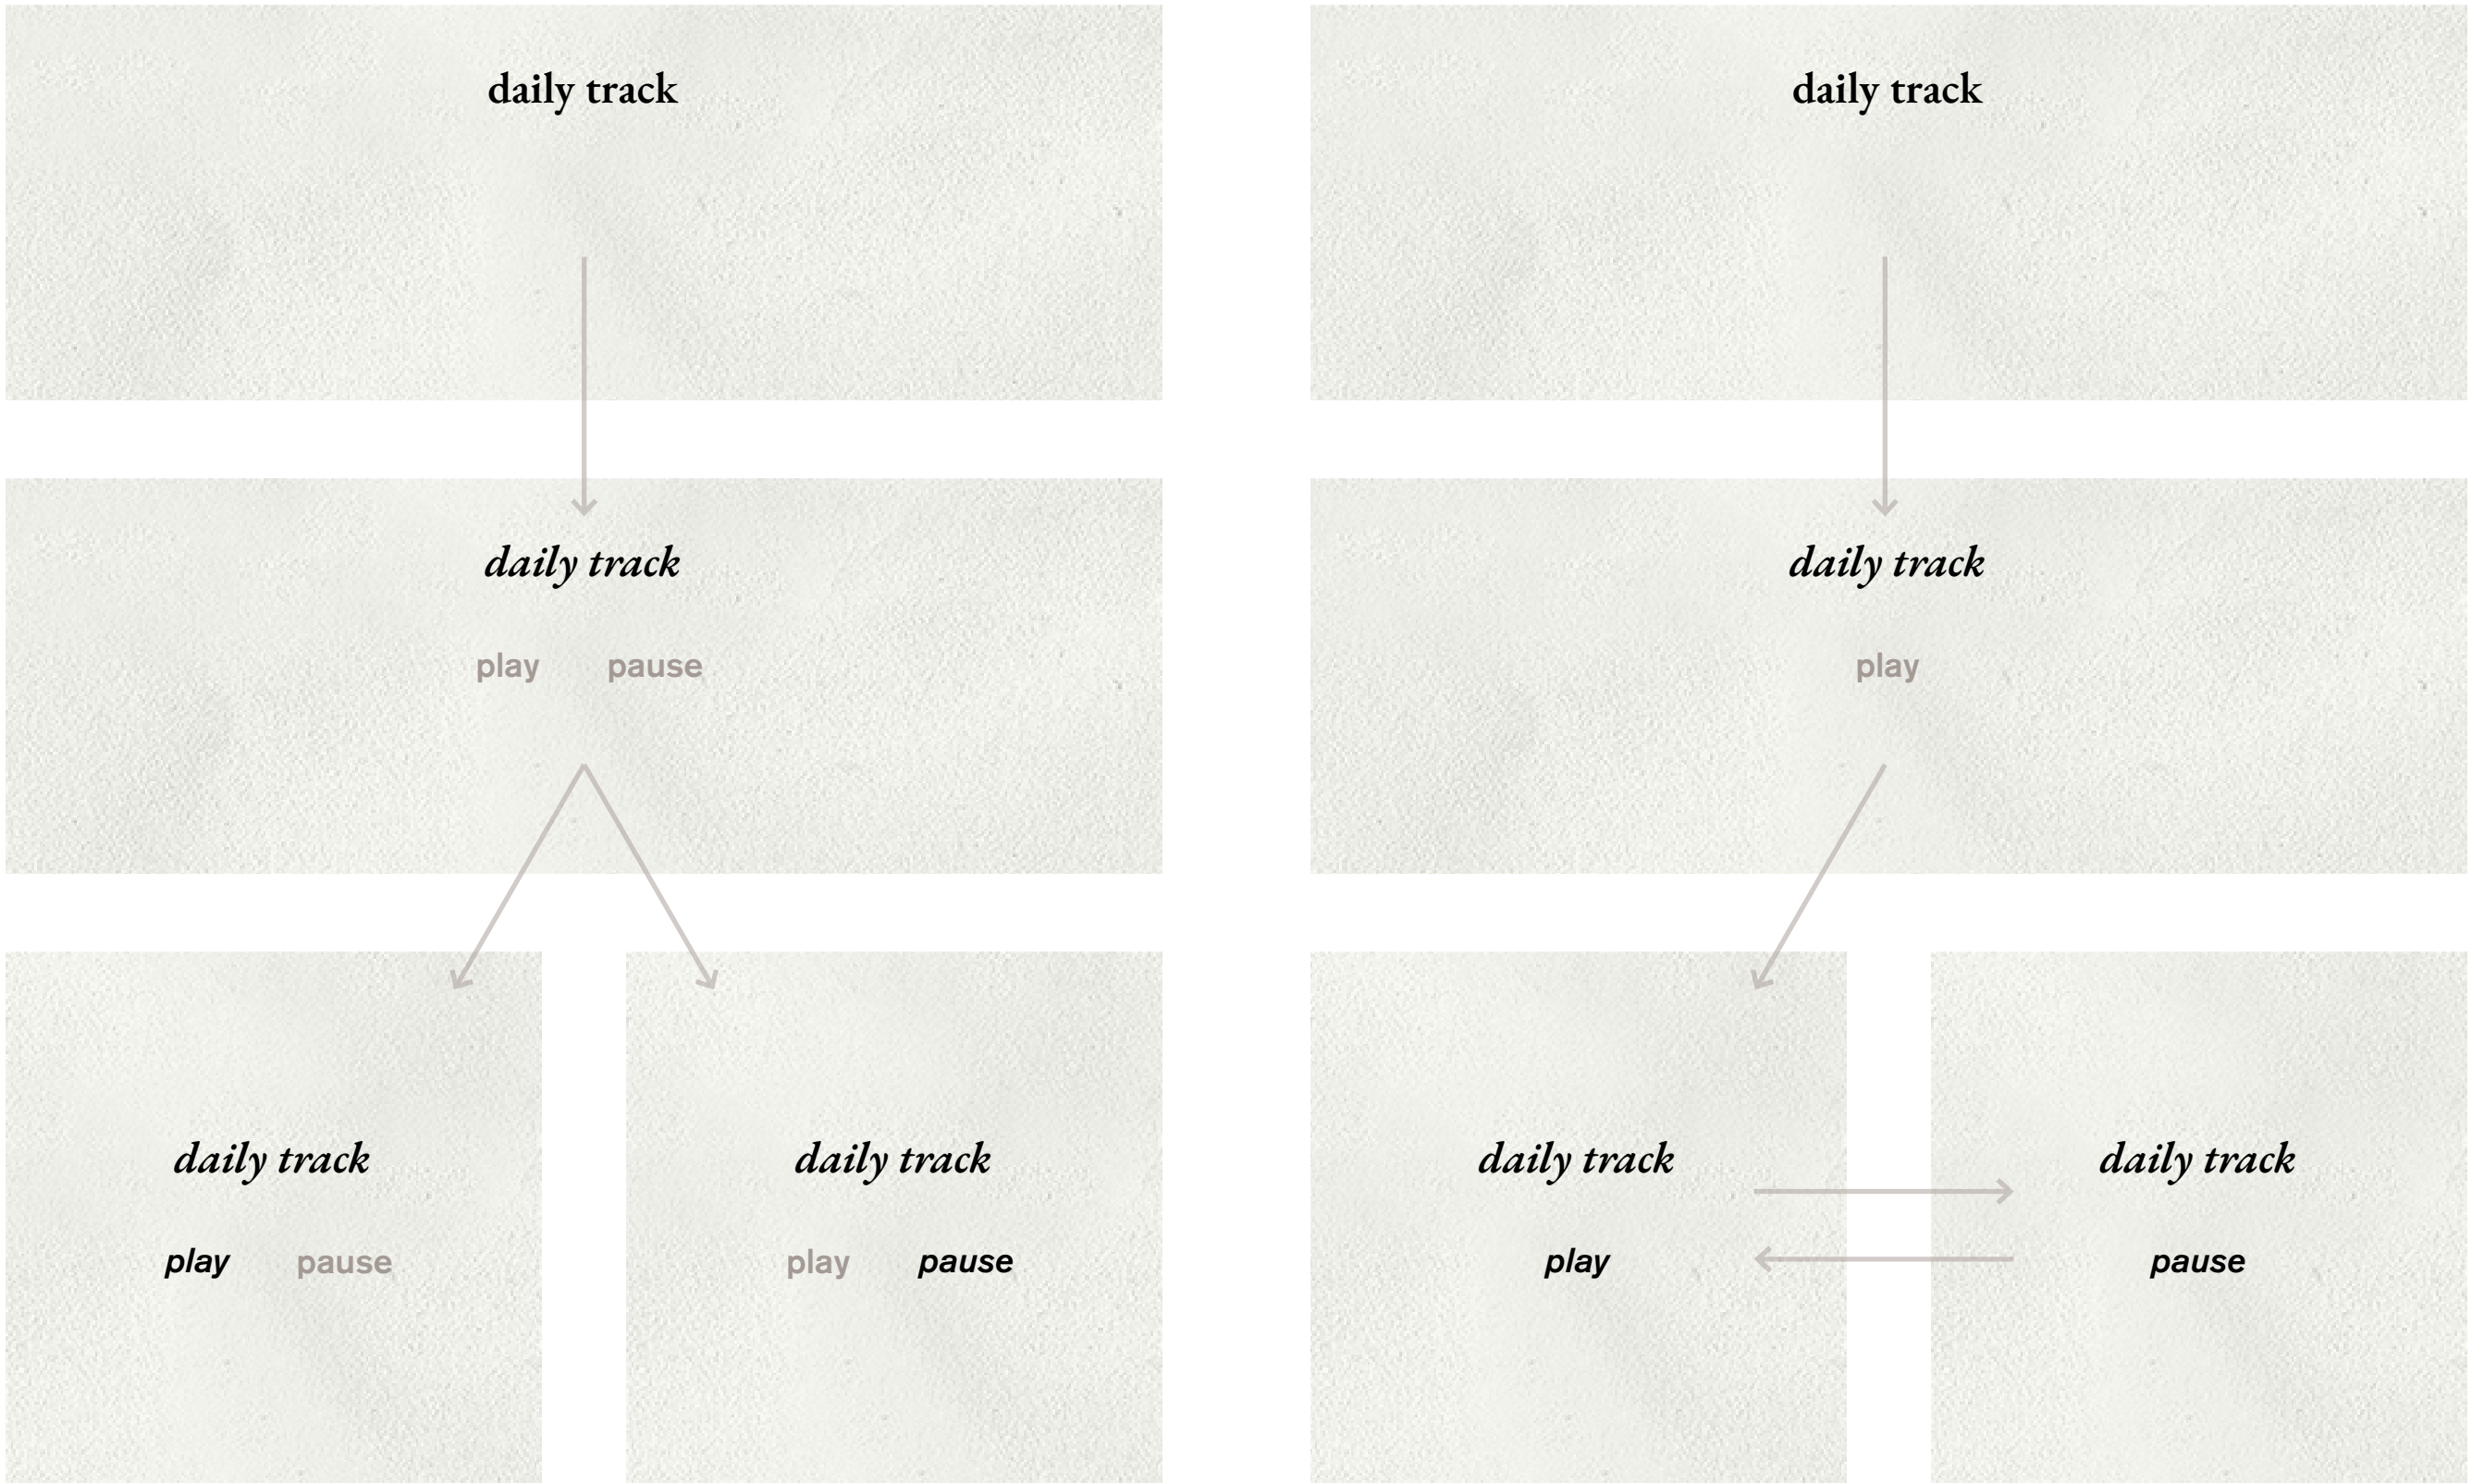

this one has a little animation that indicates that a track is playing, in the form of a disc orbiting the player controls. it assumes an understanding of player design.

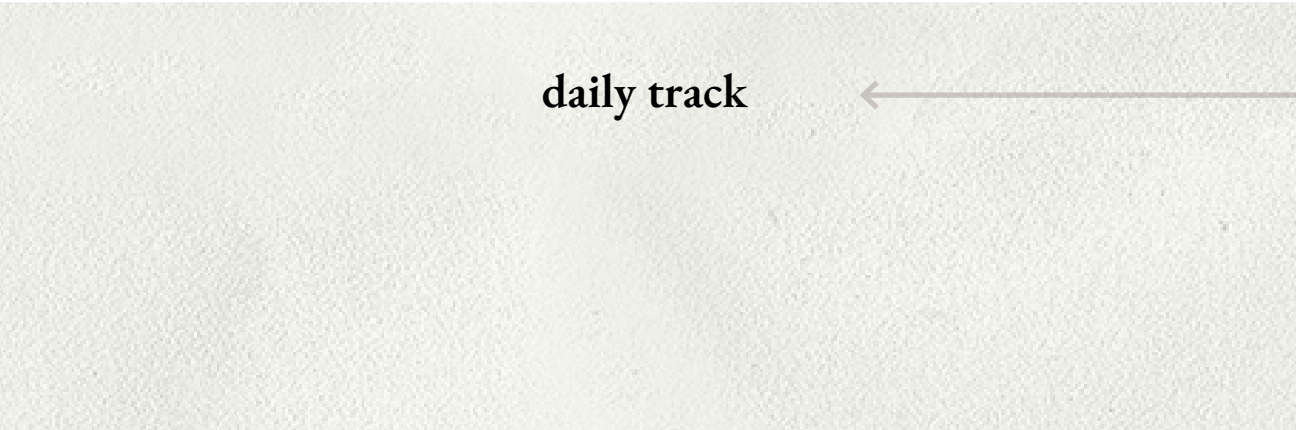

another option is to have a simple on/off switch that appears below the “daily track” menu item. the user can either press “play” or “pause”. illustrated below, are two methods of implementing this

this keeps with the ‘type-mostly’ direction of the website. eschewing the intrusion of a separate graphic element to clash with the images featured in the posts.

**a third option is to rely only on the website’s already established elements. Making it such that the user can only play or stop (not pause) the song through a click (toggle) of the “daily track” menu item.**

**not adding an additional element cleverly implements the feature, narrows the user’s input, encourages full playback, and, in turn lengthens the time on our site.**

**song has not started, or has been stopped**

**song is playing**

default interface  
media query span > 1200px  
min-padding-left/right : 50px

shop

listen up

references

we could mature the feature further by  
implementing other data points beyond just day of  
the month.

for example, we might say that on any given day  
between 6am and 6pm the feature pulls a song  
and that between 6pm and 6am it pulls another.

obviously this doubles the length of the playlist,  
which means more songs to choose – it also  
means that we are building more complexity for a  
user to uncover.

this example lets us also deepen the mood of the  
tracks chosen by structuring in breaks between  
dawn and dusk.

one more idea is to add a visual component  
to the feature.

this could be done by creating a folder similar to  
the playlist used to set up the feature that pulls  
from a bucket of images/painting/photographs  
that are deeply evocative to us.

the immediate drawback is more work to  
implement. however, an easy solution would be to  
upload many such images (more than the amount  
of tracks) and have the feature pull them at  
random. abstracting the song/image association.  
creating enough randomness of association so as  
to not show our hand, so to speak - that this is a  
limited, unaltered, pool.

**now let's tackle  
our mobile interface.**

**though it isn't really *for* mobile.**

**insofar as it actually covers *any* browser window (on *any* device)  
that makes the default interface feel/look/behave awkwardly.**

the reason being that we are making an  
adaptive website interface and *not* a responsive one.

**Adaptive design allows us to set up interface breakpoints that favor the design  
and its usability in spite of, or in-line with, browser/device limitations.**

**and so, in testing the website on our desktop browser,  
we see that at anything lower than a width of 1100px  
the website's features and functions begin to break down.**

**This is a good indication that we might want to force an interface  
break around there. In fact, to be safe, we can do so at 1200px  
so that the website never feels constrained for the user.**

**we are not leaving *some room* on the table,  
adaptive design allows us to bypass that and make hard rules  
(as opposed to recommendations/suggestions).**

**the point of this website's default interface is not to accomodate  
all users *no matter what*, it's to present an environment that is ultimately  
enjoyable, all the while *remaining* accessible to all users.**

**the point is also not to make users wish they were using  
one interface over another by limiting use of either, but to place parameters  
that serve to highlight the default interface's many features.**

**as it stands, we are saying ..**

**a browser window at least 1200px will display the default interface.**

**and**

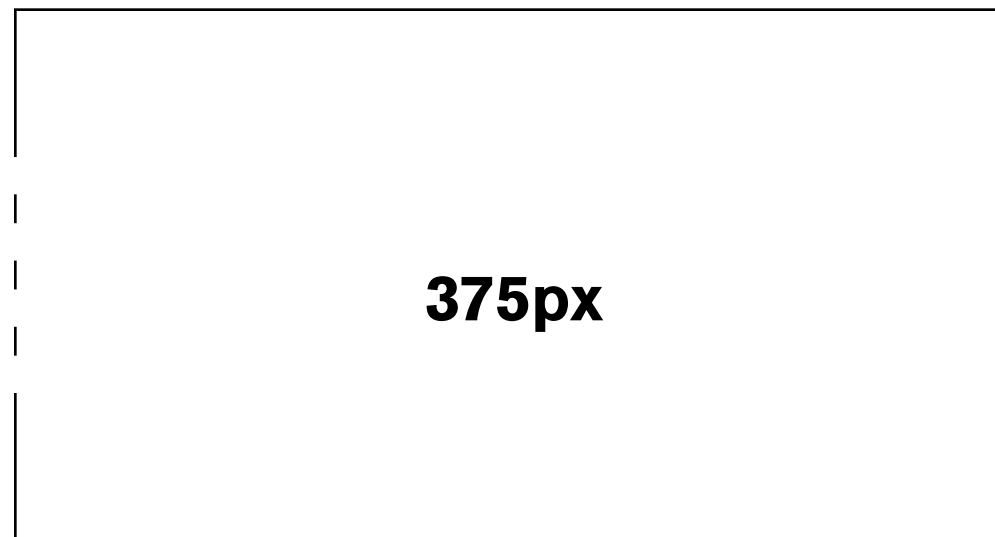

**any browser window less than 1199px will display an alternative interface.**

**this means our alternative interface must work**

**from this**

**to this**

**(the screen width of the iphone mini 12)**

**within that alternative interface there can be responsive solutions.  
one such solution would be a break in hierarchy that is triggered between  
portrait and landscape orientation. this is easily implemented  
using the “every layout” tool “sidebar”.**

**this solution admits not only usability but also to use-cases.  
we can safely assume that most people whose browser window is narrower  
than 1199px are browsing on a mobile device like a tablet or phone.**

**with that being said, we can then make design decision  
for the alternative interface that favor mobile use  
(the removal of hover interactions and menu-nesting for example)**

**now, what are the elements  
that make up our website?**

**removing contextual styling from the default interface**

**there's a landing page.**

**with room for a nice picture, and the 'tomorrow started' title**  
that cleverly toggles both the main interface, as well as,  
the main pop-up window (which displays a timeline of all our posts)

there's a footer menu.

on that menu is a window toggle for searching

window toggle for 'archives'

panel toggle for 'categories'

tab toggle for 'randomizer'

window toggle and a sound cue for 'daily tracks'

window toggle for 'meet the cast'

window toggle for 'tomorrow started'

**there are 3 collapsible lists.**

**1 for shopping for cool stuff  
1 for websites that play cool music/radio  
1 for cool online reference website**

**selecting any item on those lists redirects you to a new tab**

there's a set of windows that can be toggled on and off.

**the main one shows you all the posts in descending chronological order**

**the meet the cast window reveals all the contributors to the site**

**the daily track window shows a random image from a preselected set**

**the archives window lets you browse over a decade of posts by month**

**and once inputted, the search bar brings you to all matching posts**

there's also a new tab trigger.

**the 'randomizer' menu toggle returns a random post from our database**

**each post can be selected.**

**this brings you to a new tab with a wholly separate interface, just for that post**

**with that settled.**
